

The language of agriculture.

www.agXPlatform.com

“A farmer who farms from the age of 20 until 60, has 40 years to farm, but only 40 crops to learn from.”

Legitimate to think we can learn from other fields and soils

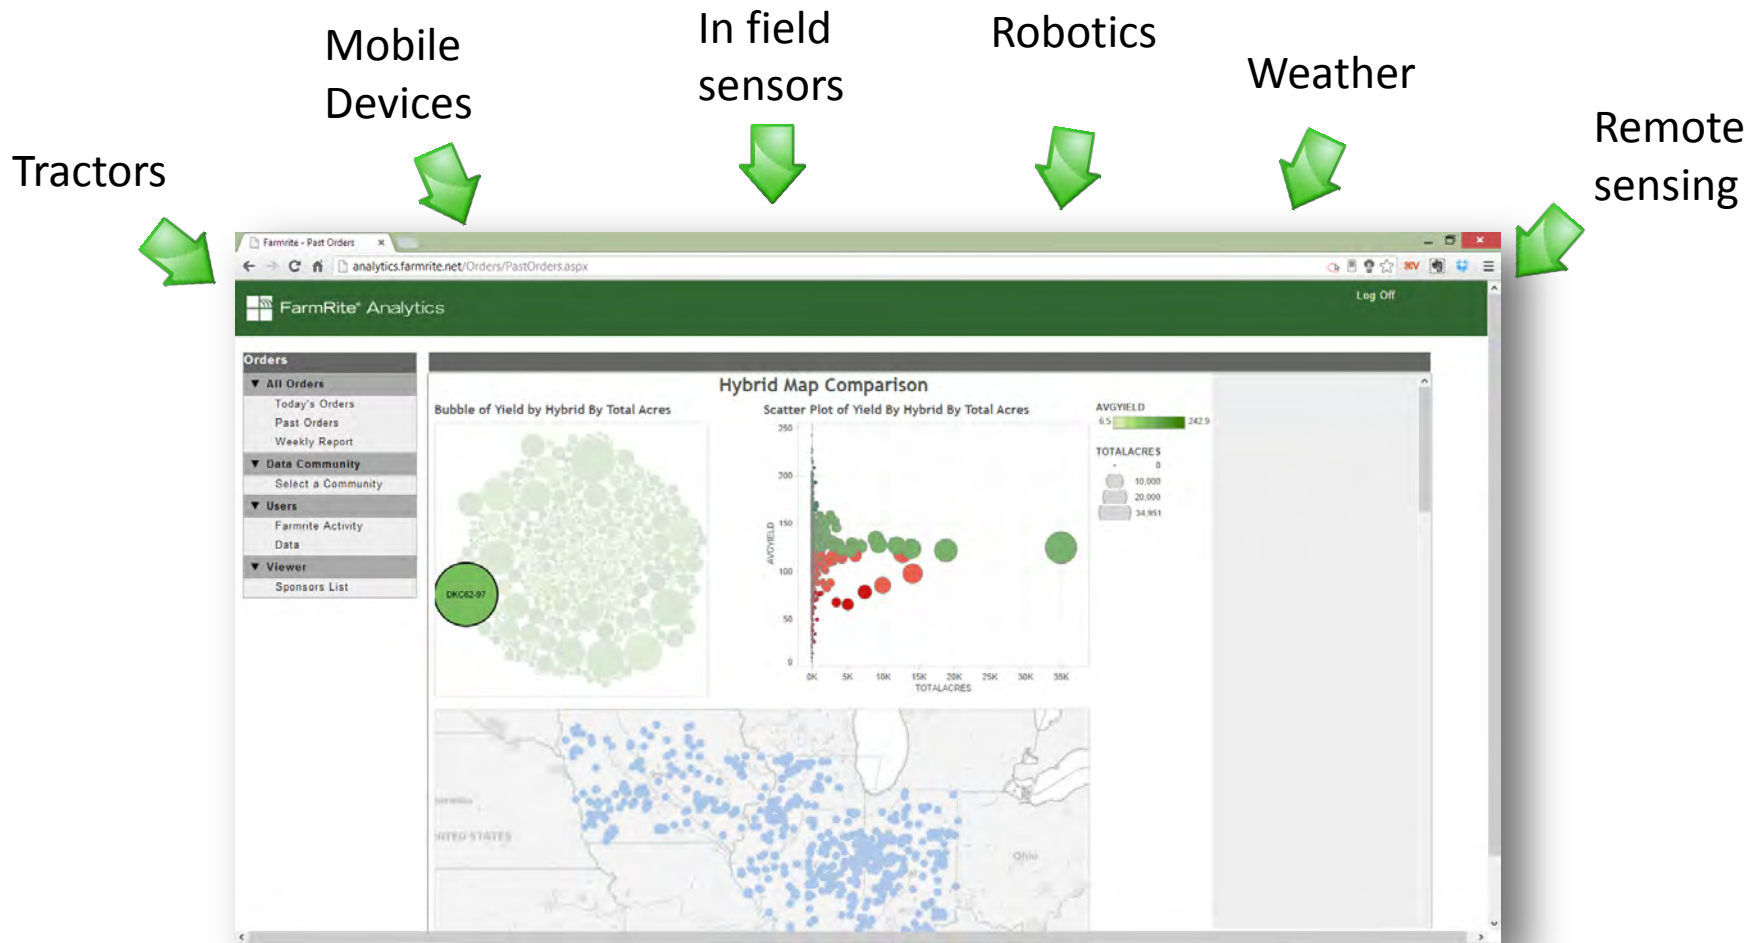

Big Data comes from lots of small data!

Collect it once- for business value – share it as needed

Recreational data keeping wont work!

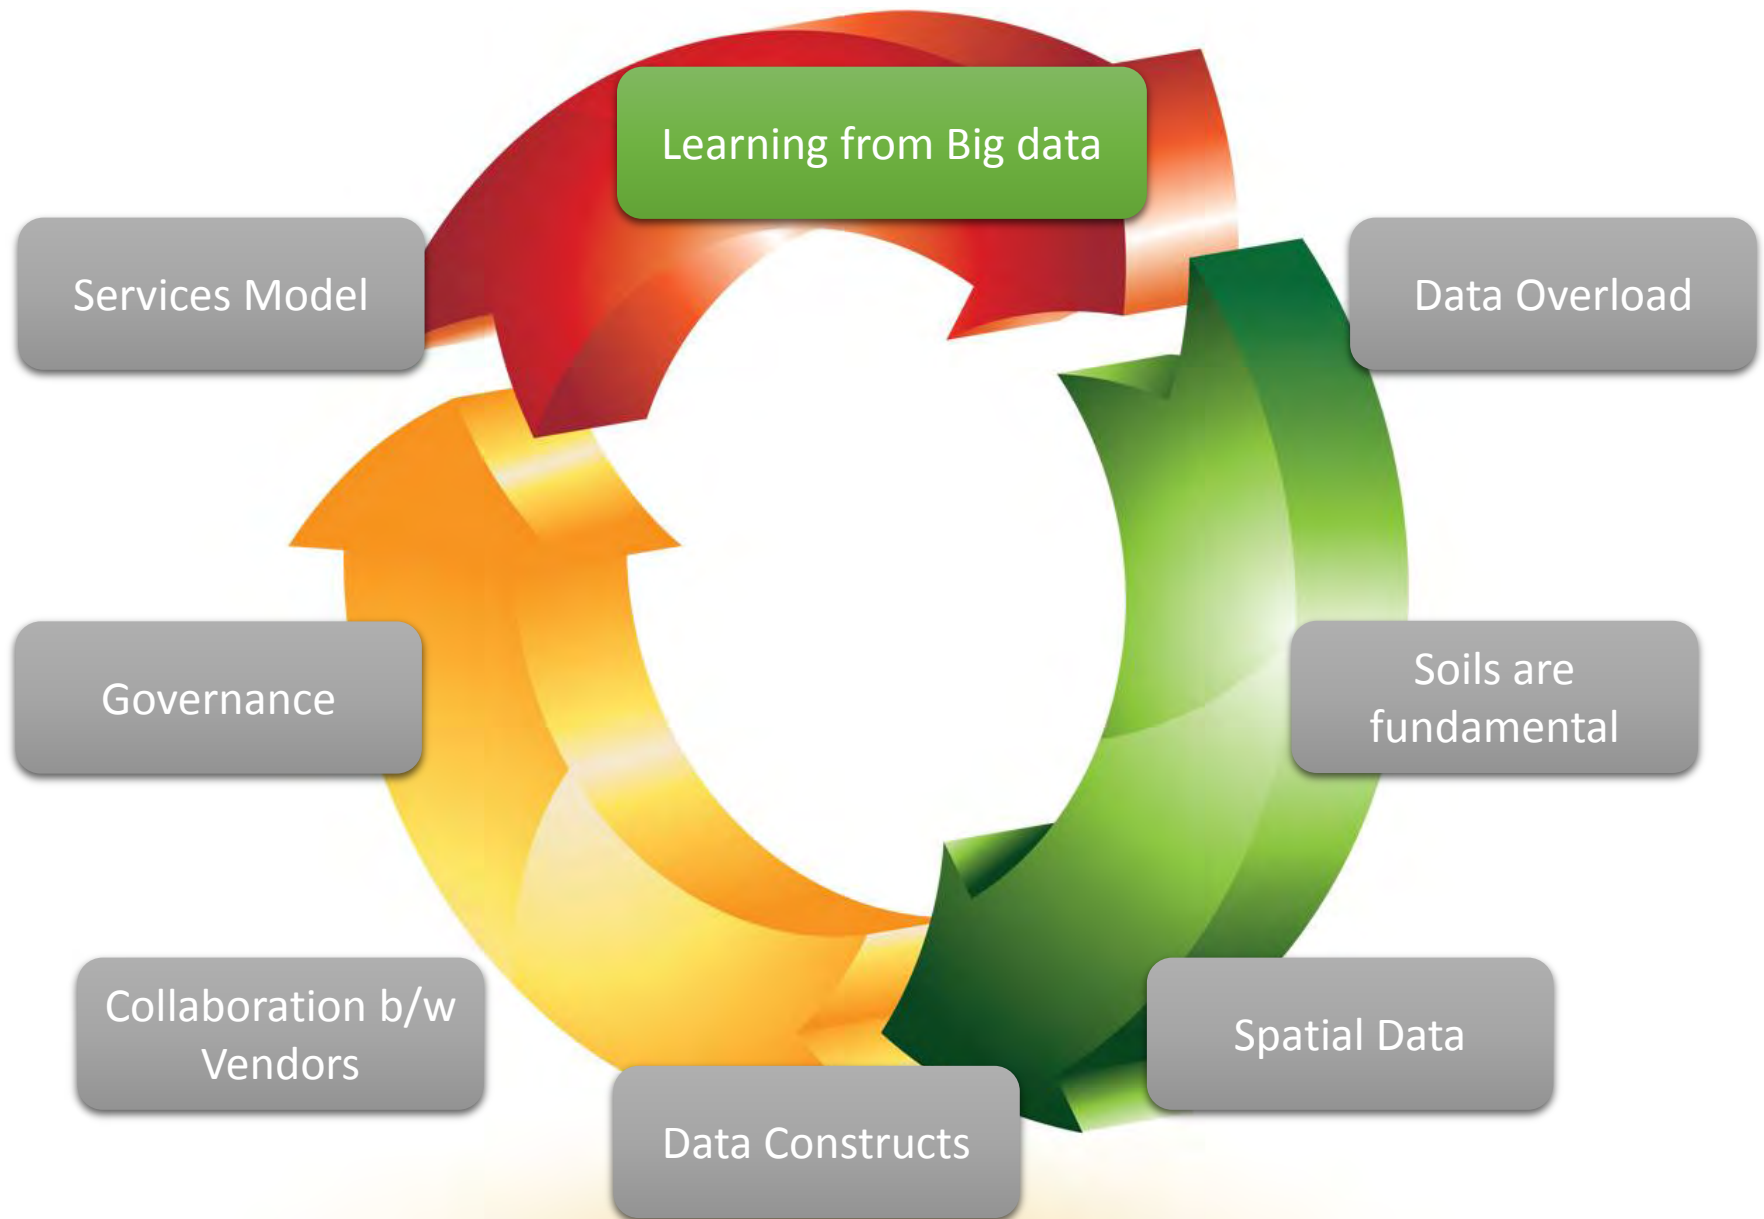

Interpretation will be key to extract value from Big Data. Industry effort.

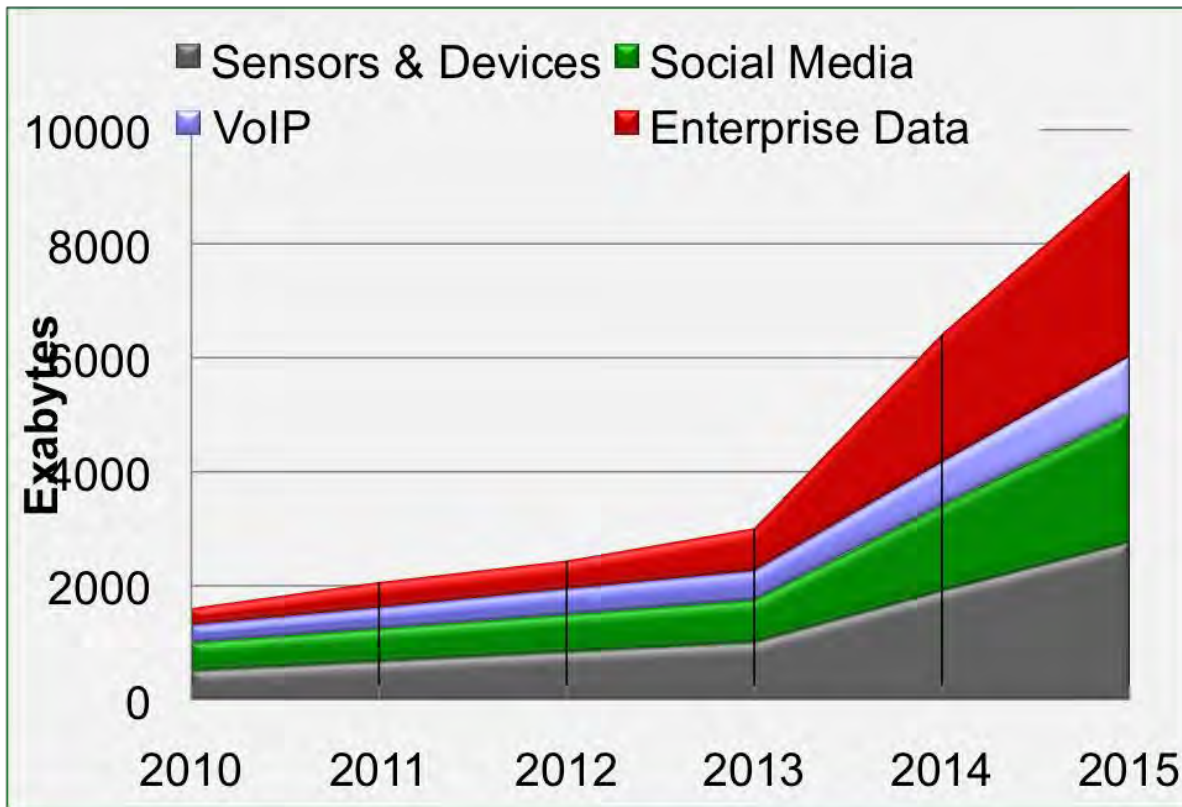

Multiple vendors = Dealing with proprietary data formats – Red, Green, Etc

Key Issues

Drinking from the Firehose!

More data is not
always more value!

A Data Driven World

More connected devices than people

- 2010 = 12.5 billion
- 2015 = 25 billion
- 2020 = 50 billion

Source: Cisco

Where is agriculture in the big data game?

- Roughly one exabyte

Soils are fundamental

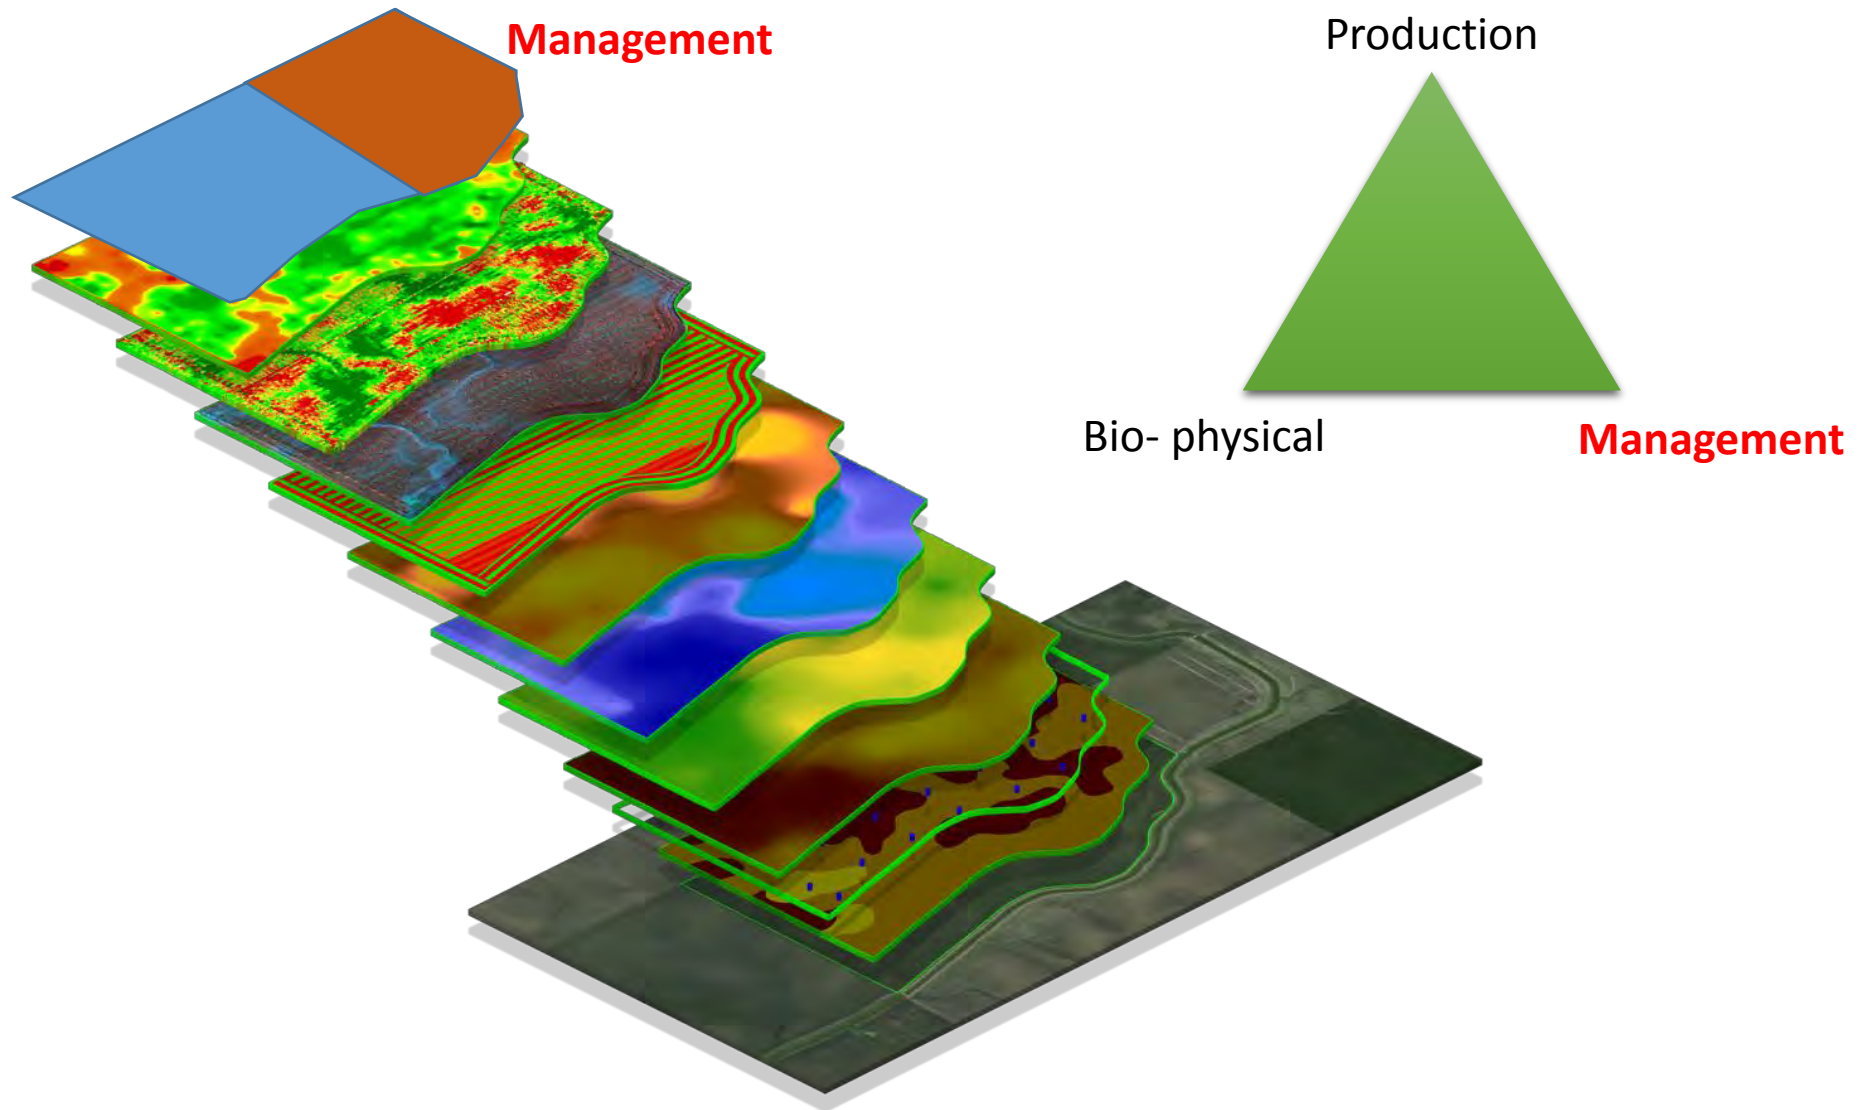

Surgo Soils data X

Soils data will
pay a dividend

Spatial Data

Data Standardization

agX[®] provides a framework for how data is collected, stored and communicated.

An example of a user populating a planting operation using standardized Content picklists.

SST Software
Manage Data. Harvest Information.

Core Layers

Multi vendor marketplace - app redundancy

Peer-to-Peer Style API Integration

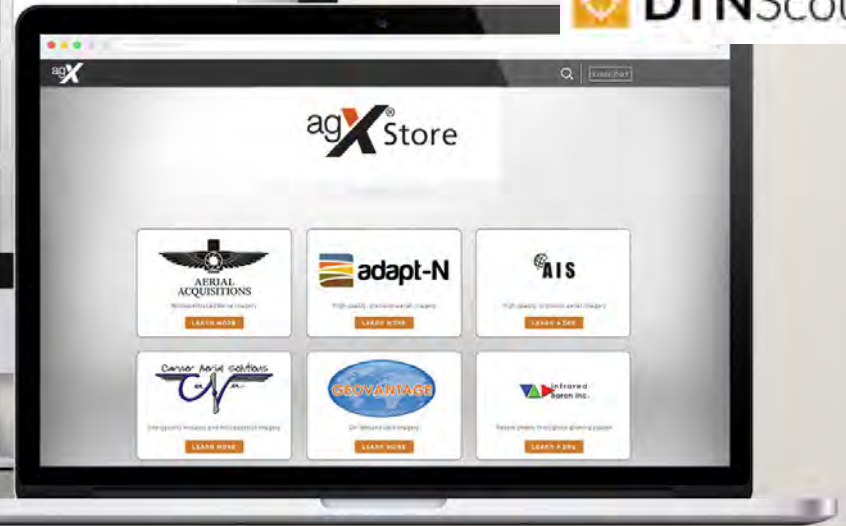

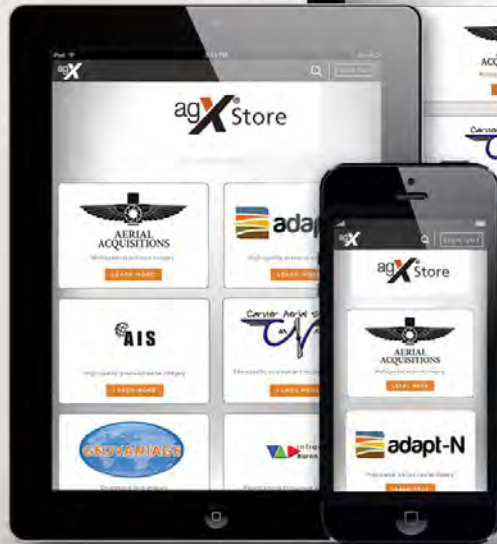

agX Central Spatial Repository

Open Marketplace

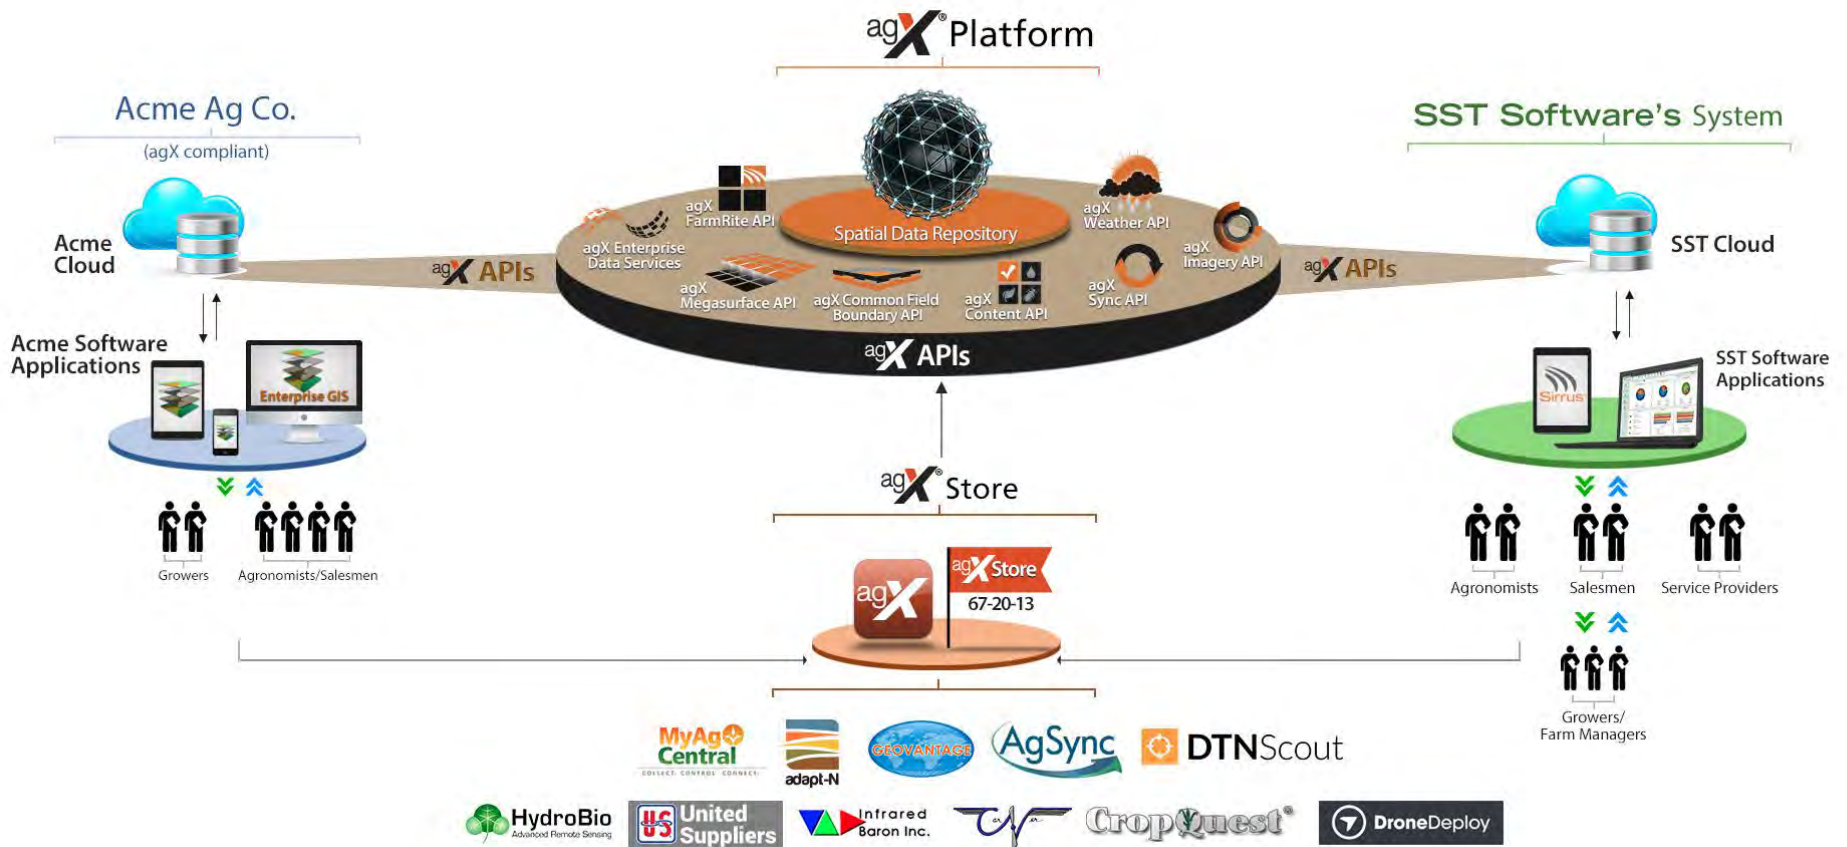

agX APIs

agX Store

Open Marketplace

Governance

Standardising data and not data Standards

Not for Profit

Ideal Governance

Supply Chain Dominance
